

AKAMAI INTELLIGENCE GROUP

INDEPENDENT R&D; LABORATORY -- DISTRIBUTED AUTONOMY GOVERNANCE

WHO WE ARE

AIG develops governance-first multi-agent AI architectures that remain stable under adversarial conditions -- Byzantine compromise, prompt injection, epistemic drift, and degraded comms -- without central orchestration.

Core thesis: alignment is a property of governance architecture, not isolated models.

IDENTITY

Entity: Hawaii Domestic LLC
Ownership: 100% Minority-Owned (Filipino-American)
SBA 8(a): Eligible -- application pending
NAICS: 541715 / 541512 / 541330
Patents: 6 Provisional (AIG-PAT-001 to 006)
Proposal: DARPA DICE SBIR Phase I

CORE CAPABILITIES

CAP-001 Distributed Governance Architecture Multi-agent frameworks: bounded authority, compartmentalized cognition, trust-lineage integrity, no central orchestration.	CAP-002 Adversarial Resilience Engineering 16 attack categories validated. Byzantine tolerance confirmed below 10% node compromise.
CAP-003 Ingestion-Layer IPI Defense Infrastructure-level IPI mitigation. 14-category threat taxonomy, cryptographic chain-of-custody.	CAP-004 Stigmergic Coordination Substrates Pheromone-analog state buses, 25 signal types, emergent pattern detection.
CAP-005 Adaptive Network Topology Biologically-derived self-optimizing topology. Flow-reinforced conductance. Zero protocol rerouting overhead.	CAP-006 Contested Edge Deployment Air-gap-capable. 5W sustained compute, zero cloud dependency, local open-source inference.
CAP-007 Human-AI Governance Interface Design HITL gate integrity, trust asymmetry monitoring, 4-level persuasion friction classification.	CAP-008 Covert Counterintelligence Architecture Out-of-band governance coordination and meta-level identity attack defense. Empirically validated.

RESEARCH PORTFOLIO

5 peer-review-ready papers: distributed governance, adversarial resilience, biomimetic coordination topology, covert counterintelligence architecture, and human-AI trust dynamics.
